

DAY 3

If you get stuck or feel missing refer this code file
Github Code: [Aayushpradhan88-js/Webdev](https://github.com/Aayushpradhan88-js/Webdev)

1. Forms (User Input)

→ Forms allow users to **interact with your website**.

Examples:

- Login forms
 - Signup pages
 - Contact forms
-

Form Elements (Concept)

- Input → user enters data
 - Label → describes input
 - Select → dropdown options
 - Button → submit action
-

Key Understanding

→ Forms are used to **collect data**, not just display content.

Common Mistakes

- Missing labels
- Confusing input types

2. Basic Semantic Tags

→ Semantic tags give **meaning** to your HTML.

Examples:

- Header → top section
 - Footer → bottom section
-

Why it matters

- Better readability
- Helps developers understand structure
- Improves accessibility

3. HTML5 Basics

→ HTML5 introduced:

- Better structure
 - New semantic elements
 - Improved browser support
-

Key Idea

→ Modern HTML is not just about structure—it's about **meaning and clarity**

4. Data Validation

→ Validation ensures users enter correct data.

Examples:

- Required fields
 - Email format
 - Input restrictions
-

Why it matters

- Prevents wrong data
- Improves user experience

5. Common Debugging Scenarios

→ At this stage, students start facing real issues.

Common Problems

- Form not submitting
 - Inputs not working correctly
 - Layout breaking
 - Missing attributes
-

Debugging Approach

- Read the problem carefully
- Check structure
- Verify attributes
- Test step by step
